

Do harness design choices travel together? Pairwise association of the 38 coding dimensions

(a) complete pairs only — DESIGN signal
(both dimensions carry a value; n varies per cell)

(b) not_reported as its own level — DOCUMENTATION behaviour
(shown as a contrast; not evidence about design)

Sequential scale: corrected Cramer's V is bounded in [0,1] and cannot be negative. Grey = dimension excluded (free-text identifier) or too few observations. unresolved cells excluded throughout. Panel (a) is the primary result; per-pair n, permutation p and BH q are in data/analysis/family_associations.csv. White lines separate schema layers. Rendered by scripts/analyse_families.py.
