

Are the candidate design families really documentation strata?

(a) cluster at k=9 — PROVISIONAL, families not supported

(b) documentation completeness

If the gradient in (b) reproduces the partition in (a), the 'families' are documentation artefacts rather than design families. Per-cluster mean coded share spans 29.9% across all clusters and 3.5% across the 3 clusters holding at least 5% of the analysis set (Kruskal-Wallis $H = 31.6$, $p = 0.00011$); the per-cluster numbers are in `data/analysis/family_cluster_summary.csv`. Metric MDS on the same Gower distance as the dendrogram. Rendered by `scripts/analyse_families.py`.
